          hypothetical protein T22D1.2 - Caenorhabditis elegans
C)Species: Caenorhabditis elegans
C)Bate: 29-Oct-1999 #sequence_revision 29-Oct-1999 #text_change 21-Jan-2000
C)Accession: T32711
R)Gefael, C.; Bradshaw, H.; Hawkins, M.
submitted to the EMBL Data Library, December 1997
A; Bescription: The sequence of C. elegans cosmid T22D1.
A; Reference number: Z21211
A; Reference number: Z21211
A; Satus: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-302 - GEI->

T. FUNCTION: Trithorax group (trx6) protein required for embryonic segmentation, development of the notum and wing margin, and photoreceptor differentiation. Required for the activation of genes such as Antp, Ubx and Eve. Binds to DNA without specific affinity, suggesting that it is recruited to promoters by promoter-specific proteins. Essential component of the Brahma component of the Brahma component and acts by remodelling the chromatin by eats SNI/SNI Complex and acts by remodelling the chromatin by catalyzing an ATP-dependent alteration in the structure of nucleosomal DNA. This complex can both serve as a transcriptional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA-BINDING, AND IDENTIFICATION IN A BRAHMA COMPLEX WITH BRM AND SNRI.                                                                                                                                                                               --- SUBUNIT: Component of the Brahma complex, which is composed of Brw, Osa, Mor, Snri/Bap45, Bap111/Dalao, Bap55, Bap60 and Bap47.

Interacts with Pur and Chi via its EHD domain.

--- SUBCELLULAR LOCATION: Nuclear.

--- TISSUE SPECIFICITY: Ubiquitously expressed in early embryo. In third instar larvae, it is ubiquitously expressed in wing and eye-anterna imaginal disks, with a stronger expression in a band just anternior to the morphogenetic furrow.

--- DEVELOPMENTAL STAGE: Expressed both maternally and zygotically.

--- DOMAIN: The ARID domains mediates the binding to DNA.

--- SIMILARITY: Contains 1 EHD (Eyelid homology) domain.

--- SIMILARITY: Contains 1 EHD (Eyelid homology) domain.

--- SIMILARITY: Contains 1 EHD (Eyelid homology) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               633 GGYKMGGPGQSPGAQGYPPQQPQQYPPGNYPPRPQYPPGAYATGPPPPFTSQA----GAG 688

Tian L., Nelson D.L.;

Mutations that cause the Miskott-Aldrich syndrome impair the interaction of Wiskott-Aldrich syndrome protein (WASP) with WASP interaction of Wiskott-Aldrich syndrome protein (WASP) with WASP interacting protein."

J. Immunol. 162:5019-5024(1999)

-!- FUNCTION: May have direct activity on the actin cytoskeleton. Induces actin polymerization and redistribution.

-!- SUBUNIT: Binds to WASP, profilin and actin.

-!- SUBUNIT: Binds to WASP, profilin and actin.

-!- TISSUE SPECIFICITY: Highly expressed in peripheral blood mononuclear cells, spleen, placenta, small intestin, colon, thymus. Lower expression in ovary, heart, brain, lung, liver, skeletal muscle, kidney, pancreas, prostate and testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

"The 5'-flanking region of the synapsin I gene. A G+C-rich, TATA- and CAAT-less, phylogenetically conserved sequence with cell type-specific promoter function."; J. Biol. Chem. 265:14932-14937(1990).
                                                                                                                                                                                                                                                                                                                Name=Synapsin IA;
IsoId=P17600-1; Sequence=Displayed;
Name=Synapsin IB;
IsoId=P17600-2; Sequence=VSP 006316, VSP 006317;
PIM: SUBSIRATE OF AT LEAST FOUR DIFFERENT PROTEIN KINASES. IT IS PROBABLE THAT PHOSPHORYLATION PLAYS A ROLE IN THE REGULATION OF SYNAPSIN I IN THE NERVE TERMINAL.
SYNAPSIN I IN THE NERVE TERMINAL.
                                                                                                                              Grafham D.;
Submitted (JUN-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Neuronal plosyhoprotein that coats synaptic vesicles, binds to the cytoskeleton, and is believed to function in the regulation of neurotransmitter release.
-!- SUBCELDUAR LOCATION: Synapse.

Nuclear envelope pore membrane protein POM 121 (Pore membrane protein POM121 NDA) (P142)
POM121 OR NUP121.
Rattus norvegicus (Rat).
                                                                                                                                                                                                                                 Hallberg E., Wozniak R.W., Blobel G.,
"An integral membrane protein of the pore membrane domain of the
nuclear envelope contains a nucleoporin-like region.";
O. Cell Biol. 122:513-521(1993).
-!- FUNCTION: Essential component of the nuclear pore complex. The
repeat-containing domain may be involved in anchoring components
of the pore complex to the pore membrane.
-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. NUCLEAR PORE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28 KARTSYVDETLP----GSPAGTRPTPPDFDPPWEKANRTRGVGKEASKALGAKGSCETT

Name=Synapsin IB;
Isoid=PF7599-2; Sequence=VSP 006114, VSP 006315;
PTM: SUBSTRATE OF AT LEAST FOUR DIFFERENT FROTEIN KINASES. IT IS
PROBABLE THAT PHOSPHORYLATION PLAYS A ROLE IN THE REGULATION OF
SYNAPSIN IN THE NERVE TERMINAL.
SIMILARITY: Belongs to the synapsin family.
                                                                                                          GPAADSOKLSMGGLHSSRPLKRGLSHSLTHLNVPST-GHPATSAPHTNGPQDLRPSTSGV

EMBO J. 17:977-984(1998)
-!- FUNCTION: Neuronal phosphoprotein that coats synaptic vesicles,
binds to the cytoskeleton, and is believed to function in the
regulation of neurotransmitter release.
-!- SUBCEINLAR LOCATION: Synapse.
